The blue line in the chart above right shows the trend in underlying SPAD risk since the Sept 2006 benchmark date. At the end of June, the underlying level of SPAD risk was estimated to be 74% of the

This update regarding SPAD and TPWS performance for June 2014 is based on data available as at the date of issue and is subject to change as further information becomes known.

The AMT refers to SPADs which have occurred in the last 12 months of the relevant period. Last month and last year are what the respective measure was at those points.

A TPWS intervention occurs when TPWS applies the brakes before, or in the absence of, the driver doing so.
A TPWS activation occurs when a driver has already applied the brakes before the TPWS operates.
